Explanatory Notes:

1. The Asian Screening Limits (ASLs) are merely harmonised detection limits adopted by the signatory countries (and conveyed by instruction from racing authorities to their laboratories) for use in the screening of the specified therapeutic substances. **The ASLs are NOT international thresholds.** When this detection limit is exceeded in the screening process, qualitative confirmatory analysis will be followed to confirm the presence or absence of the prohibited substance. **Accurate quantification is NOT REQUIRED for reporting** as these therapeutic substances are prohibited by the relevant rules at all levels.

2. ASLs are NOT APPLICABLE to the concurrent detection of a diuretic (for urinary ASLs) or a pharmacologically related medication.

3. Urine and plasma ASLs of the same medication are to be applied INDEPENDENTLY.

4. The ASLs stated herein are identical to the International Screening Limits (ISLs) recently adopted by the International Federation of Horseracing Authorities.

\* Unless indicated otherwise, the stated ASL is the free and conjugated concentration of the parent substance or a specified analyte in equine urine; or the free concentration of the parent substance or a specified analyte in equine plasma.
